

BankFlow Product and Service Manual

Ground-truth reference for the simulated application's capabilities.

Customer Services

Registration, login, profile management, multiple accounts, deposits, withdrawals, internal transfers, inter-bank transfers, beneficiary management, transaction history, statements, notifications and payment tracking.

Account Services

Create, view, freeze, unfreeze and close accounts subject to authorization and state rules.

Balances use integer minor units. The financial ledger is the accounting source of truth.

Transfer Service

Internal and inter-bank transfers use idempotency keys so retries do not create duplicate effects.

Inter-bank workflows can enter pending, timeout, reversal or reconciliation states.

Admin Services

Authorized administrators can view users, inspect accounts, freeze/unfreeze accounts, inspect transactions and payment states, review reconciliation mismatches and inspect audit events.

Notifications

Email, SMS and push notifications are simulated asynchronously and are never the source of financial truth.

Boundaries

BankFlow is an educational simulation. It does not provide actual payment-network connectivity, regulatory certification, real KYC/AML processing or real-world financial guarantees.

The AI assistant must not invent undocumented BankFlow features.
